Introduction

Jarrell New Elementary School #3 is a new stand-alone facility designed to serve 900 students in grades Pre-Kindergarten through 5th grade, with a maximum capacity of 1,000. Grade level alignment, the program of spaces, and the project budget were discussed and developed during a series of meetings with the district. Huckabee worked with JISD's design committee and contributing staff to confirm and refine the program and design intent. The current design is consistent with planning efforts and subsequent design committee meetings.

Site Development

The current site concpet is designed to fit a 20 acre track of land. A topographical survey and geotechnical investigation will further inform the development of the site itself and the building's foundaitonal system. The location of the site will also need to be investigated for its relationship to city limits of Jarrell, as well as the Edwards Aquifer Recharge Zone. These will both have impact on permitting process and design regulations.

Upon obtaining a site, further study into the existing roadway and future improvements to the ROW will be critical for interaction with existing road infrastructure. The new site pavement is anticipated to be constructed using reinforced concrete pavement. The necessary sub-grade treatment is unknown pending the geotechnical investigation.

The site design will include an on-site underground storm water drainage system to convey rain water from within the property limits to the outfall point. The site will require storm water detention to maintain existing runoff rates. If the site is located within the Edwards Aquifer Recharge Zone, water quality permitting through the TCEQ will be required. Permanent water quality measures and storm water detention areas will be located on the site.

Plantings will be geared to satisfy District and governing requirements. Areas disturbed by construction will be turf stabilized with either sod or seed. Irrigation will be provided where necessary to support required plant material.

Site Utilites

The following site utility availability will need to be investigated:

- Water service (domestic and fire)
- Wastewater service
- Electrical Service
- Natural Gas Service

Building Design

The compact building plan is designed with the two-story high library space as its hub. The two-story classroom wing surrounds and looks onto this central library space. The library's learning stair provides opportunities for presentations and collaboration. Adjustable instructional spaces are located between gradelevel houses, presenting the opportunity for enhanced learning opportunities, ability for "bumper" classes, and additional capacity up to 1,000 students. The classroom wing configuration maximizes opportunities for natural light. If the budget allows, operable partitions will be provided between each pair of classrooms for grades 1-5, creating additional opportunities for collaboration.

A one-story wing consisting of the gym, cafeteria and Music room sits aside the classroom wings. The gym, cafeteria and restrooms can be isolated from the remainder of the building for after-hours events and can be accessed from both the front and rear parking lots. The gym space will be designed as a hardened space for bad weather events. The Music room is located directly behind the stage and has access via ramp to the stage.

Students arriving on foot, by bike, or by car will enter through the main front entrance. Students arriving by bus will enter next to the gym. Visitors will enter through a secure vestibule and be directed through the office. Covered walkways are provided at both front and rear entrances to shelter students. The outdoor play slab can be accessed from the gym or classroom wing. It is anticipated that the foundation system will be slab on grade, but the geotechnical investigation will confirm. The primary structural frame will be steel and exterior back-up and interior walls will have steel stud framing. The kitchen area and hardened gym space will consist of structural CMU.

The exterior of the building will be primarily limestone, with metal panel accents at upper areas. Interior finishes are to be solid vinyl tile flooring, with carpet tile and porcelain tile in select areas. Wall finishes in the corridors will be a durable finish wainscot such as ceramic tile.

Structural System

Foundation System: The foundation system will likely consist of a 5" thick slab over a vapor barrier on grade, as well as grade beams spanning between piers at load-bearing walls and perimeter walls. Drilled piers will also be present at isolated column locations.

Framing System: The building is comprised of a steel framing, load-bearing masonry walls. Lateral stability of the building will consist of brace frames, moment frames, and masonry shear walls.

Second Floor Framing: The second floor framing consists of 5" total thickness of normal weight concrete on 2" composite steel deck. The second floor slab will be supported by steel beams designed to act compositely with the concrete slab.

Roof Framing Systems: The roof framing consists of steel bar joists or steel beams typically spaced at approximately 6'-0" on center. The 1.5" deep, 20 gage (minimum) steel roof deck is supported by the bar joists and serves as the roof diaphragm as part of the lateral support system. There will also be long-span metal deck.

The gymnasium will be designated as a hardened space. The hardened space will consist of CMU load-bearing reinforced walls. The structure will be designed to resist pressures associated with a 135 mph wind speed.

Wind and Seismic analysis are performed in accordance with the design codes listed above. The lateral force resisting design shall be based on the controlling load. Seismic resisting systems and special requirements as prescribed in IBC, ASCE 7, and AISC have been taken into account. Lateral loads are transferred from the roof and second floor diaphragms to the foundation by use of brace frames, moment frames, and masonry shear walls.

Mechanical

The HVAC system shall be designed with energy efficient quality equipment, ease of maintenance and equipment accessibility in mind. The system will be designed to control the interior temperature and humidity to uniform comfort conditions. Large spaces may be zoned separately by exposure and space function. This will allow for controlling a specific area (zone) by temperature and run time to provide maximum energy efficiency.

Mechanical system shall consist of DX high-efficiency gas fired rooftop units and makeup air (MAU) units to pre-condition the outside air for humidity and temperature control. Larger areas will be conditioned using DX high-efficiency multi-stage rooftop units (RTU's). The space will be zoned using separate units for exterior

MICHAEL T. BOYLE. TX REGISTRATION #18083. 07/21/21

and interior to provide for better space comfort and control. These units will also be provided with hot gas reheat for humidity control as space type dictates. Classrooms shall have a separate RTU unit and thermostat for individual control. All rooftop units will be gas heat. All MDF and IDF data rooms will have separate air conditioning systems for 24/7 control.

Plumbing

A new underground domestic cold-water service will be provided to the building, supplied from a site water main. Where the domestic water service enters the building a shut-off valve will be provided. Throughout the building, domestic cold water will be routed to plumbing fixtures. The piping system will be sized based on the Plumbing Code requirements. The piping system will be insulated to prevent condensation from occurring on the exterior of the pipe.

Domestic hot water will be generated using two natural gas fired water heaters for kitchen and satellite electric water heaters for restrooms with integral storage tanks. The storage tanks will be constructed of unlined duplex alloy stainless steel. The units will be insulated, in compliance with ASHRAE 90.1 for thermal efficiency, and will have a minimum efficiency of 90%. The water heaters will generate and store hot water at 140°F. Point-of-use thermostatic mixing valves will reduce final delivery temperatures of hot water to the building plumbing fixtures to 110°F. The hot water piping system will have in-line circulation pumps to maintain the hot water temperature to within 10 degrees of the supplied temperature. The domestic hot water piping system will be sized similar to the domestic cold-water system. The hot water supply and return piping will be insulated to minimize heat loss.

A new underground domestic cold-water service will be provided to the building, supplied from a site water main. Where the domestic water service enters the building a shut-off valve will be provided. Throughout the building, domestic cold water will be routed to plumbing fixtures. The piping system will be sized based on the Plumbing Code requirements. The piping system will be insulated to prevent condensation from occurring on the exterior of the pipe. All of roof drainage is planned to be handled by collector and downspouts by Architect. There are no internal roof drains or associated piping.

Fire Protection Systems

The building will be provided with an automatic fire protection

sprinkler system. A fire water service supply will be extended into the building. Dry type sprinkler systems will be provided for areas where the sprinkler heads and piping will be exposed to freezing conditions external to the buildings. The dry type sprinkler systems will include air compressor, dry pipe valve, air maintenance device, etc. The wet and dry sprinkler systems will be hydraulically designed in accordance with the requirements of all agencies having jurisdiction. System will include piping, sprinklers, wet and dry alarm valve assemblies, tamper switches, flow switches, valves, drains, inspector test, test drains, fire department connections, sprinkler heads, roof manifolds, etc.

Electrical

Power will be brought to the building from the local electric utility company. The service to the building will be 480Y/277V, 3-phase, 4-wire on the secondary of the building pad mount transformer. Main switch bank is located in main electric room. Lighting will be served at 277V and motors larger than 1/2 horsepower will be served at 480V, 3-phase. Energy-efficient, low voltage, indoor, drytype transformers that are DOE 2016 compliant will be used inside the building electrical rooms to transform down to 208Y/120V for convenience receptacles and other small loads. LED lighting will be utilized throughout the building. All offices and classrooms shall be provided with dual technology occupancy sensors, and switches for a dimming lighting control system. Lighting control schemes will be further discussed with the Owner as the design progresses.

Technology & Security

Technology design will provide new telecommunication spaces, premise distribution, classroom audio/video, a facility intercom system, local sound systems, and physical security systems including access control and surveillance.

Premise distribution will be provided for all office and classroom areas. The system will be Category 6 in accordance with the district technical specifications. All face-plates, patch cables, inserts and patch panels will similarly comply. One MDF and multiple IDF rooms are included in the scope of this project. All racks and termination hardware will be selected based on the technical specifications. Each telecommunication room will be connected by a new fiber backbone.

Two four inch conduit shall be installed between the MDF location and the Service Provider pedestal at the street. Fabric inner-duct will be installed to provide separate pathways within each conduit. Facility audio/video systems will be installed in multiple locations throughout the facility. Classrooms will include fixed projection on the teaching wall utilizing ceiling mounted projectors. Audio video inputs will be provided in each room at the location of the teacher workstation.

The cafeteria will include a retractable projector screen and ceiling mounted projector. Local sound speakers will be ceiling mounted and audio video connectivity will be provided at a location selected by the owner.

The gymnasium may require local sound and may be combined with the cafeteria local sound system.

A new intercom system will be installed throughout the facility. Speakers will be installed in all classrooms, corridors, and general areas. Exterior speakers will be provided on all sides of the building as well. Additionally, clocks will be installed in the corridors, library, offices, gymnasium, and cafeteria.

A new controlled vestibule will be designed for the main entry. The system will include select exterior doors chosen by the district and design team. This system will include card readers on all major entrances. The communication panel for the access control system will be installed in the MDF.

A surveillance system will be designed in coordination with the design team and owner requirements. All cameras will be IP. Drop off and pick up areas, playgrounds, and outdoor learning areas will be monitored.

The facility will have an intrusion alarm system that will be managed and monitored by Williamson County Dispatch. The system will include motion sensors. The system will be provided with an emergency battery operated power supply for 8 hour support during a power outage.

Food Services

The Receiving Area is to include a receiving door with glass view window panel, intercom, doorbell, sufficient lighting and air screen located over the door. A time clock may be required at the receiving door. Security camera may be required and located outside the receiving door. One restroom to be provided with one

(locker room. Number of lockers and coat hooks to accommodate total amount of employees within the kitchen. Office will have vision panels to be located to allow the manager to view the kitchen and the serving area. Dry Storage Area to be sized to initially accommodate one delivery a week. Cold Storage Assembly to be sized to initially accommodate 7-day inventory.

The production area is to be located across from the Cold Storage Assembly. Production equipment to be sized to accommodate the total student population. Exhaust hoods to be designed to accommodate all production equipment. Exhaust system to be sized to accommodate 300 cfm per linear foot of exhaust hood. Supply air to be sized at 60% of exhaust cfm per linear foot.

The preparation area is to be located across from the walk-in cooler assembly and to be located to minimize any cross traffic from the other kitchen support areas.

The servery area is to be located between the seating and the kitchen area. A roll down door is to be provided between the serving line and the seating area. The serving line to be designed to accommodate the owner's menu as required. Beverages to be located at the beginning of the serving line. Serving lines to be sized to accommodate the student population and number of periods. Each serving line to accommodate approx. 100 students per line per period.

The bakery area is to accommodate scratch or par-baked cooking. A store front glass wall or roll down door is to be provided between the serving line and the seating area. Serving lines to be sized to accommodate the student population and number of periods. Each serving line to accommodate approx. 100 students per line per period.

Dishwash/Scullery area to include three compartment sink with drainboards and pot rack, disposer with pre-rinse, hand sink and drying racks.
